

UTILITY COORDINATION SERVICES

Coordinating the management of affected utilities during civil and infrastructure construction projects.

Utility Coordination

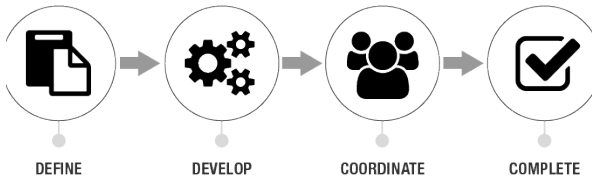

Utility Coordination is the organizing, management and protection of utilities that are being affected during new construction projects. Utility Coordinators are responsible for the management of the utility relocations and conflicts throughout the project, these utilities mostly include power lines, telecommunications, water and wastewater pipelines, gas mains, and other underground and above ground utilities and facilities.

In the initial stages we will develop a comprehensive list of agencies involved and throughout the design process, we will act on behalf of the agency or its consultant to facilitate the transfer and sharing of information to lead to project success.

Our Services.

We provide Utility Coordination services where existing utilities may be present during:

- Placement of new utilities
- Relocation of existing utilities
- Upgrading of utilities
- Roadway design and construction
- Redevelopment of existing facilities

Our Process.

We ensure we meet with our clients up-front to define the scope of services they need and the project goals they want to accomplish. From project concept through completion, we will provide the resources of our experienced staff of professionals, technicians, and specialists who are dedicated to our client's success.
